

F O R E W O R D

This statistical summary is the fourteenth in a series on vegetable crops in Florida.

It was made possible through the joint efforts of the Florida Crop and Livestock Reporting Division of the Agricultural Marketing Service, U. S. Department of Agriculture, the Department of Agricultural Economics, Agricultural Experiment Stations, University of Florida, growers, shippers, and other informed sources throughout the State.

This summary shows acreage, production and value of 18 commercial vegetable crops and other related data. The severe weather during the winter of 1957-58 lowered production on the crops hereinafter estimated to about 33 million cwt., and the gross valuation to an estimated \$132 million, or approximately \$31 million less than that of last season and \$51 million less than the \$184 million record high of 1954-55.

Data showing production and harvesting costs for certain crops in selected areas are presented as a five-year average in lieu of no survey of this nature covering last season.

It is our objective to provide growers, small and large, with timely crop information. Even more timely information would be very helpful. A step in this direction has been underway in recent years for celery and tomatoes. Such information has a leveling and stabilizing influence in minimizing exaggerations and counteracting unfounded rumors. This volume is herewith submitted for your careful consideration and use as a source of statistical information.

ACKNOWLEDGMENTS

With the exception of the shipment information, the data contained herein are estimates and are based on reports by, and interviews with growers, shippers, marketing associations and organizations, seedsmen, railroad representatives, canners and other processors.

We gratefully acknowledge our indebtedness to each person and organization contributing to the development of these data. We further acknowledge the assistance extended by the Agricultural Extension Service through its County Agricultural Agents, the Federal-State Inspection and Market News Services, the Florida State Marketing Bureau, the Florida State Farmers Markets, the Agricultural Stabilization and Conservation Committee, the State Plant Board, the State Industrial Commission through its farm labor placement service, the Florida Tomato and Cucumber Marketing Agreement Committees, the U. S. Weather Bureau and Frost Warning Service and many other well informed sources.

Much credit is due our entire clerical personnel for the painstaking work they have done in preparing this bulletin for publication. Arlene Kruse and Doris Schankweiler handled most of the assembling of data and cutting of stencils.

I N D E X

Each crop generally carries the following sequence of data by season: Name of crop - Season; Acres for harvest by counties; Acreage, production and value - State summary; Acreage and production by counties and areas, 1957-58; Shipping data; Per acre costs and returns. Crops that harvest in more than one season are then combined in one total grouping classified as "all" and placed before the breakdown by seasonal groupings.

ESCAROLE and CHICORY	44-45,48	ALL CROPS (Summary)	98 - 99

DEFINITIONS AND EXPLANATIONS

SEASONAL GROUPINGS - In order that competitive production within the State of Florida and the United States may be classified on a National basis under reasonably uniform groups, we have established a National pattern which is based on the most active harvesting periods. These major groups are WINTER, SPRING, SUMMER, and FALL. The WINTER group includes the months of January, February, and March; SPRING includes April, May, and June; SUMMER includes July, August, and September (Florida carries no official summer commercial crops); and FALL includes October, November, and December. These periods are not rigidly fixed and the harvesting period for a particular grouping may extend into the preceding or following group. However, in arranging our data we have followed these groupings in so far as it is practical. For example, it has been considered practical to carry cabbage, cauliflower, escarole, lettuce, and strawberries as one season crops, designating them WINTER since the volume production is harvested generally during January, February, and March. Since some systematic order of grouping is necessary it is deemed best for all concerned to handle our classifications on a National basis even though they may not always agree with some local designations now in use.

PLANTED ACREAGE - The definition for planted acreage is based on a "loss of crop" concept. Estimates of planted acres for any seasonal grouping consist of acres for harvest (see next paragraph) during that particular seasonal group plus any acreage planted for harvest during the season, but which was lost or destroyed and did not produce a crop in the season under consideration. If the acreage is lost and not replanted it is counted as planted. If it is lost but replanted for harvest in the same season as the original acreage would have been harvested, the acreage replanted is not considered as additional acreage planted. However, if the acreage lost is replanted for harvest in a later season, it is considered as planted for both seasons and as acres for harvest only for the latter season.

ACRES FOR HARVEST - This is considered as being all acreage from which a crop could have been harvested had economic conditions (prices, available labor, etc.) warranted the harvest. It includes mature acreage on which the harvest was postponed or delayed too long due to economic reasons and the production lost thereby. Acreage which produces such low yields or poor quality that the crop is not worth picking at any reasonably price is considered as crop failure and is not included in the acreage for harvest. Unharvested acreage which produces yields which would be harvested at reasonable prices is included in acreage for harvest.

YIELD - Yield refers to total production of merchantable quality produced on an acre basis and may include some unharvested production left in fields for economic reasons.

PRODUCTION - Total production represents the yield times (X) the acres for harvest. Production of value is that part of the production which was harvested and sold or utilized and does not include economic abandonment.

ECONOMIC ABANDONMENT - This category includes mature production not harvested because of economic factors, such as low prices, shortage of labor, etc. Such loss of production includes quantities left in fields partially harvested as well as production on acreage abandoned for economic reasons. In the production tables in this book economic abandonment is the difference between the total production and the production of value.

Acreage abandoned at any stage of growth before maturity will be considered as loss of acreage or crop failure rather than economic abandonment of production.

AVERAGE PRICE - All prices used in this report are per hundredweight on an f.o.b. basis or its equivalent, less selling charges. (Comparable average prices per standard unit is shown in parenthesis).

TOTAL VALUE - The total value is the average price per hundredweight times (X) the production of value.

CANNED OR PROCESSED ACREAGE AND PRODUCTION - The acreage of vegetables in Florida planted solely for canning and other processing purposes during the period covered by this publication has been confined principally to cucumbers for pickles. The acreages of beans and tomatoes, the principal crops processed, are planted primarily for fresh market, but each year substantial quantities are canned or frozen.

In order to show the utilization of the production from the acreage brought to harvest, three columns on production are used in the State Summaries. The first shows the total production, the second shows the production sold for fresh market consumption, and the third shows the production sold for processing (either canned or frozen). Production abandoned for economic reasons is the total production minus the sum of the production for fresh market and processing.

Those desiring to know the equivalent acreage utilized for processing should divide the number of hundredweight processed by the average yield then generally round to the nearest hundred. The prices given for processed beans and tomatoes are based on a per ton price and reduced to a per hundredweight price (rounded to the nearest whole cent.)

COSTS AND RETURNS PER ACRE IN SELECTED AREAS IN FLORIDA - This feature is contributed by the Economics Department of Florida Agricultural Experiment Stations. These tables represent the summarization of grower records or estimates of costs and returns per acre from several vegetable crops in the major producing areas of Florida for a five-season average, 1952-53 to 1956-57, since no survey of this nature was conducted covering the 1957-58 season. In so far as possible, growing and harvesting costs have been separated and labor items excluded from costs of materials.

MIXED CAR MOVEMENT - Total shipments of produce in mixed cars are shown by months on Page 85. These data include the equivalent cars shown in our regular shipment data under each specific crop carried in this publication.
